Philmac is well renowned for quality products and services. Philmac manufactures pipe fittings and valves under a Quality Assurance System assessed and approved to ISO 9001. Philmac has a NATA accredited laboratory and tests fittings and valves to international and national standards. Third party accreditation is carried out by SAI Global.

Disclaimer
Please note that the information, opinions, recommendations and advice given in this manual are supplied only to provide an improved understanding of the technical aspects of fitting systems.
So far as the law allows, Philmac Pty Ltd will not accept liability in respect of any loss or damage of any kind claimed to arise as a result of reliance upon any information claimed in this manual.
Please refer to our Terms and Conditions of sale.

Standards

Philmac Push is a complete range of mechanical fittings designed to make connections simple when joining metric PE pipes.	Philmac Push is designed to comply with the requirements of the following standards: AS/NZS4129 Fittings for polyethylene pressure pipe systems. AS/NZS 4020 Products for use in contact with water intended for human consumption with regards to their effect on the quality of water.	ISO7.1 Pipe threads where pressure joints are made on the threads. Philmac Push connects pipe that conforms to - AS/NZS4130, Polyethylene pipes for pressure applications. Products comply with the lead-free requirements of the national construction code – volume 3.
--	---	---

Product Specifications

Fittings For PE To PE Pipe Connection Guidelines for the specifications of Philmac Push compression fittings. Manufacturer Accreditation Fittings are manufactured to comply with the ISO9001 Quality System. Product Performance Accreditation Fittings for Polyethylene (PE) pipes meet the applicable performance requirements of AS/NZS 4129 with specific reference to: a) Pressure Testing [ISO 3458] b) External Pressure resistance testing [ISO 3459] c) Resistance to pull out of test assemblies at 20 degrees C [ISO 3501] d) Internal pressure resistance when subjected to bending stresses [ISO 3503] Threaded ends of fittings are tapered and conform to ISO7.1 [specification for pipe threads for tubes and fittings where pressure tight joints are made on threads]. Product Material Accreditation	Performance verification has been conducted according to test parameters outlined in Clause 1.12.2 and 2.4.3 if AS/ NZS 4129 – Verification of long term behaviour. Fittings are suitable for the conveyance of drinking water and conform to AS4020 [products for use in contact with water intended for human consumption with regards to their effect on the quality of water]. Product Configuration/ Material Overview Fittings are of the compression fitting type. Fitting bodies are of polypropylene material and the collet, spacer and grip ring is acetal material. Each fitting are supplied complete and pre-assembled with captivated collet, spacer and grip ring and seal inside the body. O-rings shall be made of EPDM. Fitting body colour is black so as to minimise potential light transmission and/or UV degradation.	Method of Connection To achieve a leak proof joint, the pipe is pushed through the collet, grip ring and o-ring pre-assembled inside the fitting’s body, till it reaches the internal end stop which provides positive installation feedback. The collet and grip ring is engineered with a reverse-taper design providing axial end-load resistance by producing sharp indentations that effectively lock the pipe into the fitting body. Disassembly & Reassembly To disassemble, simply loosen the nut. The only tool you might need is a standard wrench. Any pipe preparation will be limited to cutting and cleaning of pipe [for foreign material or burrs]. Fittings do not require the pipe to be lubricated or chamfered during installation.
---	--	--

Installation Instructions

1. Cut pipe square and to required length using the flange on the central body as a guide. Ensure end of connecting pipe is undamaged and clean.

2. The fitting is pre-assembled and ready to use.

3. Take the pipe and insert it into the fitting, you'll feel it hitting the internal stop once it pushes past o-ring, it's now fully installed.

Disassembly & Reassembly

4. To disassemble, simply loosen the nut. The only tool you might need is a standard wrench.

5. When you remove the nut all the components become loose and the pipe can be removed.

6. Firstly take the o-ring and place in the body

7. Then take your spacer and again place in fitting body.

8. Take the grip ring ensuring it is orientated correctly with the gripper teeth pointing downwards.

9. Take split ring, placing it on top of the grip ring with the taper facing up

10. Put the nut back onto the body, tighten up by hand.

11. Ensure the nut meets the flange. The fitting is now ready for re-use.

System Design Considerations

There are generally three types of PE pipe fittings; mechanical, push and thermofusion. Philmac Push™ is a range of push fittings that offers three distinct advantages over thermofusion fittings;

- **Less insertion force enabling quick and easy installation**
- **Quick installation, hence more economical**
- **Disassembly and Reassembly enabling the reuse**
- **Depth of pipe installation till the end stop providing positive installation feedback**

This section highlights engineering considerations when designing a PE pipe system with Philmac Push™.

Head losses

The following table offers a guide in estimating head losses in PE pipe systems based on the conveyance of water. Use the following formula to estimate this head loss;

$$L = F \times D$$

where F = fitting constant
D = pipe inner diameter [m]
L = head loss based on equivalent pipe length [m]

Fitting	Fitting Constant [F]
90° elbow	30
90° tee - straight through	12
90° tee - side branch	60

Resistance to Impact

The thermoplastic materials used in the Philmac Push™ fitting have excellent impact properties

Abrasion resistance

Philmac Push™ is suitable for the transportation of abrasive slurries and will withstand normal conditions found in urban, mining, industrial, rural water and waste water systems

Weathering

The materials used contain pigments to provide excellent protection to degradation due to ultra-violet radiation. Continuous use of the Philmac Push™ fitting in systems above ground is therefore permissible without additional protection.

Electrolytic Corrosion

Philmac Push™ is non magnetising and does not cause electrolytic deterioration.

Thermal Insulation

Polypropylene has natural thermal insulation of 2000 times over copper and 200 times over steel.

Light Transmission

The all black Philmac Push™ does not transmit light, thus protecting the water quality in potable water pipelines from growth of micro organisms.

Effect on Water

Philmac Push™ does not impart to water any odour, taste, colour, or any constituents in concentrations that could be injurious to health.

Fluids other than Water

Philmac Push™ may convey a wide variety of fluids. The following table is provided as a guide only for the compatibility of various chemicals to Philmac Push™. Contact Philmac for advice on specific applications.

Temperature

Philmac Push fittings are designed for cold water applications only. Exposure to elevated temperatures has a significant impact on the lifetime of the fittings. The minimum 50 year life specification for the fitting is based on an operating temperature of 23 degrees Celsius.
